

sep15_bad hours

Time vs ping. red = unacceptable ping, generously defined as anything above 100ms.

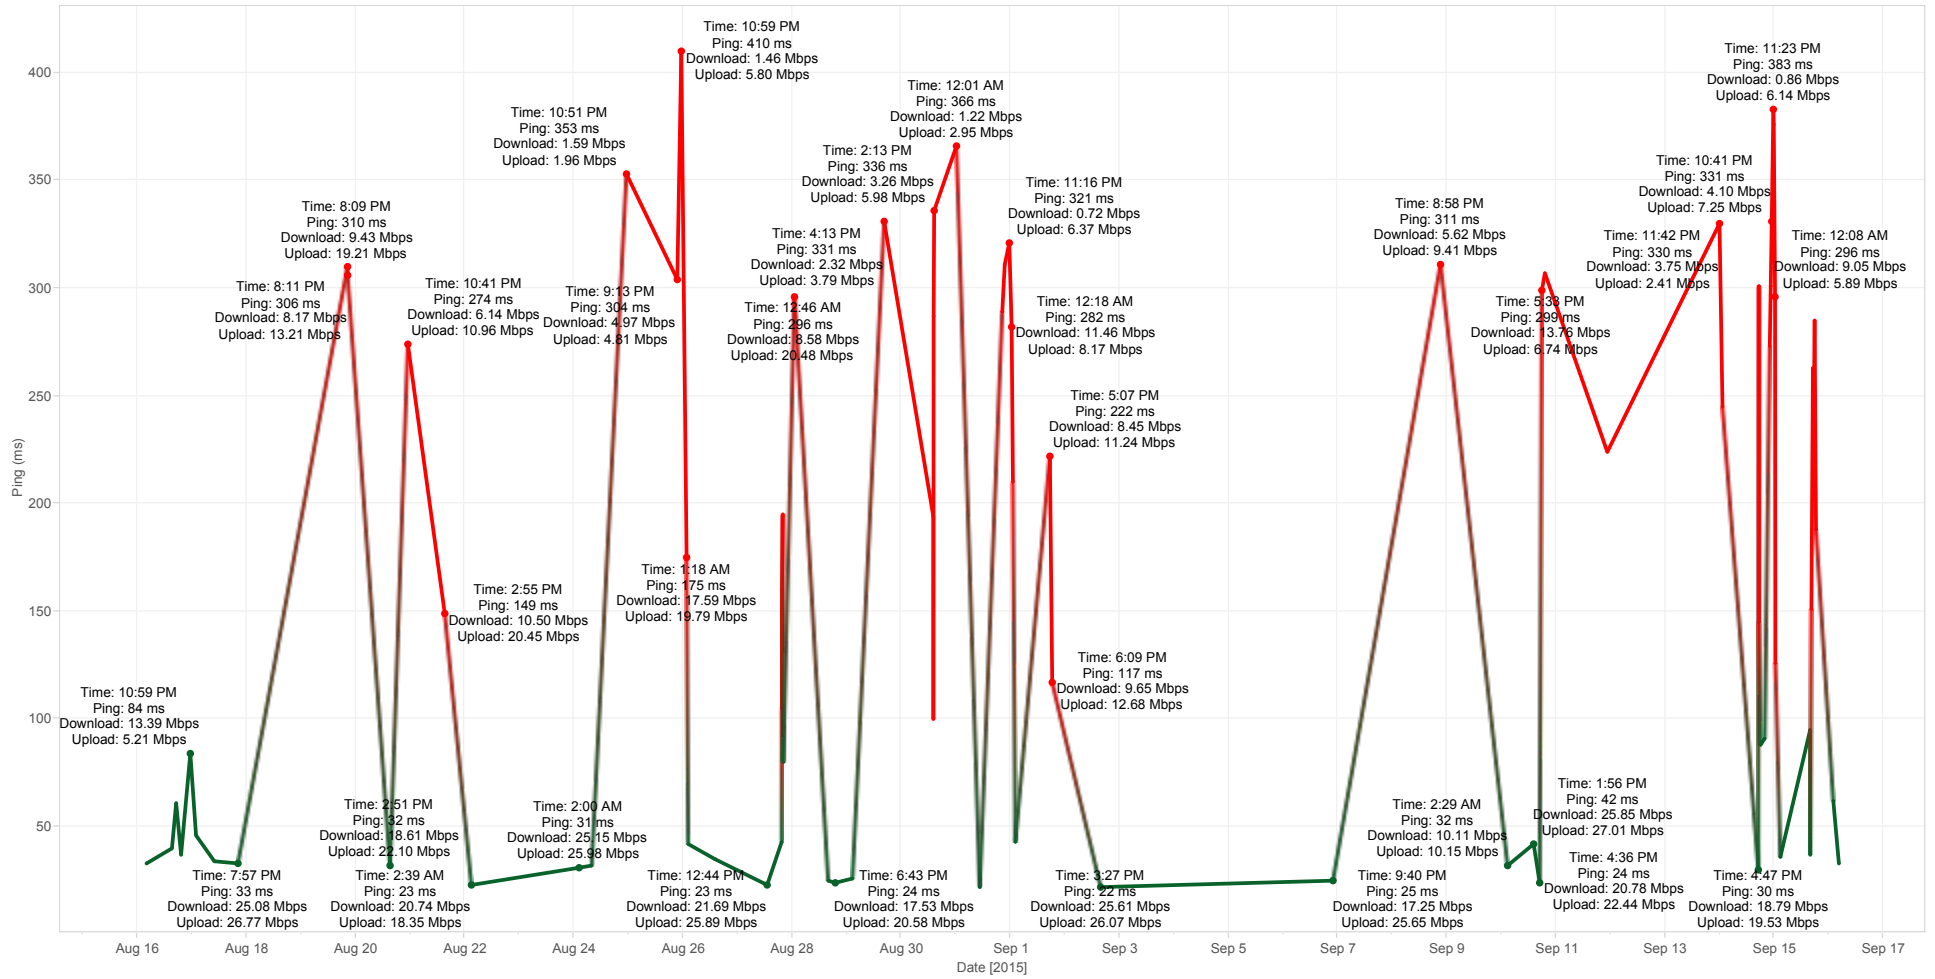

Speedtest was taken every 20 minutes, on an ethernet connection, from 3:26pm -> 4:08am, highlighting the problem. Usually the bad hours are 5pm to 2am but on this day it was 4pm to 1am.

Other device use on my router is a non issue during these tests.

Other 4 roommates experience exact same latency with routers ranging from low end to high end.

Ping is not important for netflix streaming, and loading webpages will be tolerable with high ping. Thus most users are unaware of the problem. Or this is just a problem with my unit.

since move in random tests

Time vs ping. red = unacceptable ping, generously defined as anything above 100ms.

Random speedtests done since move in, on wifi.

Other device use on my router is a non issue during these tests.
